

Similar fitted flux changes can imply different distance responses

Constructed alternatives • 1,020 DES supernovae • 39,606 accepted epochs

Hypothetical responses, not measured biases or a cosmological correction. Covariance, training and selection are fixed.

Left: all objects; lines join 10 equal-count redshift means. Points and lines are not uncertainty intervals.

The refitted response vectors differ by 1.90% in squared covariance-weighted norm on observed fluxes.

Source: resolved nonlinear fits and exact contrast membership; physical attribution remains unresolved.
